

Technology for mechanical composting of Bio-waste:

We have developed a mechanical process in which the bio-waste crushed through a chopper and converted into small pieces. After that, the crushed material is to put in vermi-pit for a 45 day. This process makes easier to earthworm to swallow the waste. Then it is turned in 10 days for the aeration process. After 40 to 45 days the cormi-cast become ready to screen as per required size. Now Bio-Compost is ready to use.
